Just the Thing for the "Arid West." ★

U. S. Department of Agriculture.

LIPPIA REPENS

new
THE BEST SUBSTITUTE
FOR LAWN GRASS 

THRIVES in any soil, no matter how poor. Rapidly covers the ground with a very dense matting.

Will smother all weeds. The more trodden upon the better it grows. Adopted in Southern Europe for lawn tennis grounds.

Takes ten times less water than any lawn. Needs no mowing. Will stand intense heat and several degrees of cold. Can easily be established on sloping ground.

For Immediate Effect Plant at One Foot Apart.

Well rooted plants, \$2 per 100; \$18 per 1,000; \$150 per 10,000.

HOW TO PLANT AND CARE FOR LIPPIA.

Have your ground well worked and pulverized. No manure recommended. Have it well levelled and rolled, if possible. LIPPIA sells in sods of about two inches square; each has many joints, and from each joint several rootlets will go down into the ground. Plant the sods one foot apart, press and firm them well in the ground, and give sufficient water to start it growing.

From each joint runners will soon appear that will branch in every direction, and will firmly anchor in the ground, rooting again as they run. Occasional rolling, although not necessary, will be of advantage; frequent walking over it will do the same effect. If the tiny lilac flowers (much sought after by the bees) are not desired, they can be easily removed with an ordinary lawn mower.

During the dry season water must be given, with a lawn sprinkler or otherwise, at intervals that local condition will suggest.

WHAT THEY SAY OF LIPPIA.

LIPPIA REPENS is doing first-class here, In my judgment it is the best substitute for grass in this part of the country.

12-13-900

C. OHNEMULLER,

Supt. Hollywood Cemetery, Los Angeles, Cal.

Our LIPPIA grew well, has spread and thrived on very little water. It makes a bright spot in contrast to the ever-present dirt. I believe it is just what California is looking for.

12-17-900

C. W. LEFFINGWELL, Jr.,

Leffingwell Ranchos, Whittier, Cal.

A very promising plant for lawns in this section is LIPPIA REPENS, a very near relative of Heliotrope and Verbena. This plant is a rapid grower, matting closely to the ground, and spreading much like a Strawberry plant, striking roots from the joints as it runs. It is evergreen, full of bloom in Summer. It is a drought resister, prospers best in the hottest places, and stands the frosts of this locality fairly well.

ALL SORTS OF PLANTS

SUITABLE FOR

DIFFERENT CLIMATES

ARE TO BE FOUND
AT THE

Southern California Acclimatizing Association

SANTA BARBARA, CAL.

We have made a special study of what is adapted for the "Arid West," where green and shade are needed and water is scarce; and we are prepared to give advice and furnish plants at very reasonable rates.

Our GENERAL CATALOGUE and GARDEN GUIDE for the SOUTH, comprising summary description, degree of hardiness, hints to culture of 2000 sorts of PLANTS, is mailed free.
